Security Features

SINGLE/DOUBLE SPOT UV MARK

A secure UV overprint, visible only under a black light provides a strong first-tier core of protection. We can print initials, logos, symbols - anything to uniquely identify the customer's chips. Double sided marking adds a further level of security to your custom gaming chips.

FULL UV BLANKET

Using scientifically enhanced processes, we offer inlays that have a completely enhanced UV blanket across the surface area of the art.

SEQUENTIAL NUMBER IDENTIFIERS

While this feature is more ideal for commemorative or special event chips, we can produce chips individually numbered from 1 to 1,000, 1 to 10,000, or even 1 to 1,000,000.

Security Features

- Perpetual edge spots.
- Laser engraving security.
- Custom design available.
- Promo chips available.
- Best value on the market!

TIERED SECURE OBJECT CODE SYSTEM (TSOCS)

Using exclusive patented technology, we are the only chip manufacturer in the world using the Tiered Secure Object Code System (TSOCS). This technology, more advanced and secure than existing United States currency, allows casino customers to individually identify chips right at the table level with smart phones loaded with proprietary software or specialized tableside devices.

TSOCS codes are like individual signatures for each chip and are uniquely identifiable, similar to serial numbers on U.S. currency. However, unlike U.S. currency, the chips or “bills” can be verified right at the table, stopping counterfeits well before they get to the cage.

Any code not authenticated into the central database hosted by the casino client is automatically identified as invalid. TSOCS are extremely difficult to duplicate (smart phone cameras are unable to reproduce the codes), they cannot be added to the database by ambitious employees, nor can denominations be changed. The signature is the signature. For example, if one million chips are produced, each of these chips has its own code and can be uniquely identified. Codes cannot be added to the database without the algorithm being produced in objects on the chip and authenticated, making these chips virtually impossible to counterfeit.

TAGGANT INK

Currently under development, we are working on highly specialized security inks that are virtually impossible to reproduce.
